Studies of the magnetic anomalies paralleling ocean ridges have furnished partisans of continental drift with decisive arguments. To take stock of this important question, my colleague Thellier and I decided in the early summer of 1967 to make it the subject of the annual seminar on Earth physics

Theory and Evidence of Seafloor Spreading | Earth Eclipse

The Theory of Seafloor Spreading. Seafloor spreading is a geologic process where there is a gradual addition of new oceanic crust in the ocean floor through a volcanic activity while moving the older rocks away from the mid-oceanic ridge.

How did sea floor spreading support Wegener's theory of ...

Sea floor spreading is the phenomena of new sea floor being created through mid-ocean ridges. Wegener proposed that the continents themselves move, which is untrue. It is the tectonic plates that move. Sea floor spreading caused the break up of Pangea, which prompted Wegener to add this in support of his continental drift theory.

How does seafloor spreading cause continents to drift ...

The image below shows the Earth's plates. Seafloor

spreading creates new oceanic crust at a mid-ocean ridge. When this new material reaches the end of the plate and comes into contact with another plate, whether continental or not, a convergent or a transform boundary will occur.

Continental drift theory was developed to explain how seafloor spreading must influence the continents. Continental drift theory, in turn, is an important part of the theory of plate tectonics. Plate Tectonic theory was developed to explain the location of oceanic trenches, volcanoes and the location of various types of earthquakes. Geologists believe that relatively heavy oceanic crust sinks
